

A STRONGER YOU

You are
Designed
to **Move**

Your body has incredible range of motion with a degree of shock absorption built in.

Nerves help coordinate your movements with the main nerves attached to the spine.

HUMAN NERVOUS SYSTEM

According to recent neurological studies, the nerves and brain communicate more easily and accurately when the spine is aligned, or in its natural S-curve position.

A large trunk of nerves run down from the upper spine through the shoulder.

Another large trunk of nerves run down from the lower spine to the hip/buttocks area.

Nerves tell
you if there's
an issue.

An arm/wrist/hand issue often stems from the trunk of nerves at the top of the shoulder or at spinal connection.

A leg/ankle/foot issue often stems from the trunk of nerves at the hip or at the spinal connection.

Lack of body strength, flexibility and poor posture cause many back and ergonomic injuries.

100 lb.

Weight of head rests on shoulders.

For example, “Text neck” puts unnecessary pressure on your back and neck muscles, making them work harder. It throws off your entire posture.

incorrect

Also, bending at the waist puts tremendous pressure on your lower back.

Regardless of what you're lifting...

- a child
- a bag of dog food
- a small object

10 pound object x 10 (10:1 ratio) = **100 pounds**

110 pounds (ave. weight of male upper body) x 10 (10:1 ratio) = **1,100 pounds**

1,200 pounds

Your Back is not Designed to Twist and Lift

Nor when:

- Using jerking movements when lifting
- Lifting while not fully grasping an object
- Lifting while off balance
- Pulling or dragging objects
- Slipping, tripping or falling

Michigan workers fall down a lot, but we don't have to.

Your back and ergonomic injury affects a bunch of people.

Co-workers have to do your job. And at home, you can be a pain in the back to be around.

WHAT TO DO:

Pay attention. Practice safety.

Work within your 'neutral zone'.

It's the safest area to conduct your work whether at work or at home.

Use Your
Strongest
Muscles - legs
and butt

Use your body equally instead of favoring one side.

Use objects to leverage yourself to take the weight off of your body while performing a task.

Increase your range of motion, flexibility and strength by practicing yoga stretches.

Massage and chiropractic can also help.

YOUR PERSONAL HEALTH

Affects Your Injury Rate

CENTERS FOR DISEASE
CONTROL AND PREVENTION

The Centers for Disease Control (CDC) reports your personal health contributes to your injuries.

Particularly related to:

- Stress
- Health
 - Chronic Disease
 - Nutrition
 - Exercise

A photograph of a male worker in a yellow hard hat and green safety vest sitting on the ground in a factory, appearing to be in pain or distress. He is surrounded by other workers in safety gear, some of whom are touching his shoulder in a supportive manner. The background shows industrial machinery and a red fire extinguisher. The image is overlaid with a red semi-transparent banner at the top right and a red semi-transparent banner at the bottom right containing text.

STRESS

The connection between stress and injury is real.

Short term stress is natural.

Your built-in “fight or flight” response is normal.

Your adrenaline kicks in and it goes away quickly.

According to the CDC, stress overload biologically causes:

- Heart Disease
- Back and Upper-Extremity Disorders
- Workplace Injuries
- Mental Health Depression
- A Poor Immune System contributing to:
 - Cancer, Ulcers, Diabetes, Thyroid Disease, Psoriasis, Crohn's Disease/Ulcerative colitis, Lupus, Rheumatoid Arthritis, Multiple Sclerosis, and more

**CENTERS FOR DISEASE
CONTROL AND PREVENTION**

Stress is Due to Fear

Your fear is caused by a 'mismatch' of some kind in your life.

Undoubtedly, COVID created uncontrollable stress to your life.
And it continues to do so.

But, what were your 'mismatches' before COVID.

Holding off making an important decision, not a good fit for the job, took on too much and can't keep up, financial issues.

The more 'mismatches' you have the more judgemental you are to yourself and others.

That's also when you feel stuck, alone and isolated.

WHAT TO DO:

ACKNOWLEDGE YOUR FEAR

Ask yourself why you feel afraid and anxious.

Keep asking this over and over to help get to the origin of your fear.

BE AUTHENTIC

According to research, 90% of what you say and do is based on what others say and do - just to fit in.

Going forward, match what you say with what you do.

It immediately reduces your fear because you are being more true to yourself. You are respecting yourself.

ROUTINE

Reduce the extra 'noise' in your life through routine. It helps you see more clearly what's really important to you.

At home: make your bed, organize your home, set boundaries with family and friends.

At work: keep your office space clean, keep projects organized so things don't pile up.

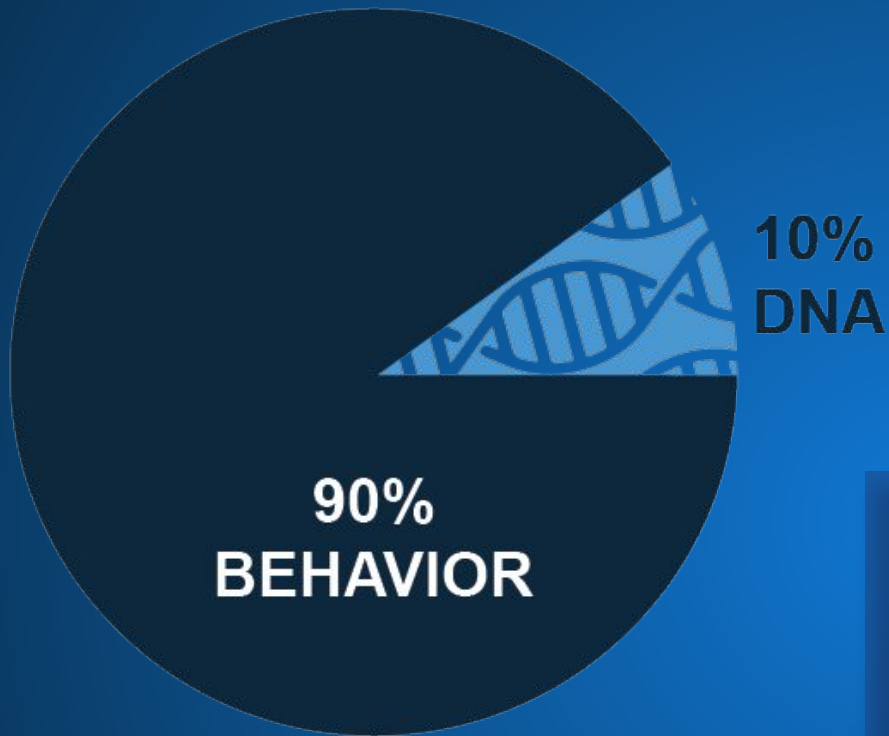

ATTITUDE

Your attitude is a game changer. It directly affects your daily life and everyone around you.

Acknowledge someone doing something nice for you is a great start to becoming more grateful.

CHRONIC DISEASE

Affects Your Injury Rate

Your Genetic (DNA) code influences 10% of your overall health. The remaining 90% is caused by your behavior.

The medical community knows this.

Michigan Adults are Not Healthy

Over 60% have chronic disease.
("underlying or pre-existing conditions")

A chronic disease like Diabetes causes multiple health issues.

Chronic Disease and Obesity

prevents your natural killer cells (immune cells) from working and contributes to autoimmune diseases (multiple sclerosis, cancer and others).

For example, with COVID-19:

90% deaths — people w/
pre-existing conditions

10% deaths — COVID alone

Conditions present in adults hospitalized with coronavirus adult patients in US

OVERALL, ONE OR MORE UNDERLYING CONDITION

HYPERTENSION

OBESITY

CHRONIC LUNG DISEASE

DIABETES

CARDIOVASCULAR DISEASE

Chronic disease affects how you feel and can be very distracting your work and home life.

A collection of medical supplies including pills, capsules, a syringe, and a pen on a document titled 'Chronic Diseases'. The background is a blurred image of various medical items: several red and purple capsules, a white syringe with a blue plunger, a red and yellow pen, and a white pill bottle with an orange cap. The text is overlaid on a semi-transparent blue rectangular area.

Physicians use medications and surgery to help control your chronic diseases. This is the traditional medical model used to train medical doctors in the U.S.

A growing number of doctors are concerned this approach is only a temporary fix.

Chronic disease is reversible - at the same time.

Research confirmed over 40 years ago that heart disease is reversible. People replaced what they ate with more fruits, vegetables and fiber. Significant artery improvement happened within weeks.
(Pre- and post-Magnetic Resonance Imaging)

The same improvement is shown with diabetes, high blood pressure and other “human behavior” diseases - regardless of age.

WHAT TO DO:

RESPECT YOURSELF

Stop and Reverse Your Chronic Disease
by Changing Your Behavior

Research confirms that if you do these four things...

- stop smoking
- exercise more
- eat better
- and avoid becoming obese

You will wipe out 90% of your risk of developing diabetes, heart attack, stroke, and cancer.

And, you will automatically reduce your injuries.

NUTRITION

Affects Your Injury Rate

Looking at your blood chemistry is the easiest way to get a snapshot of your health—inside.

It's as simple as having your blood drawn from a lab and getting a copy of the results.

The lab results tell you how well your organs and immune system are working.

Your blood chemistry is directly influenced by what you eat.

Complete Blood Count

TEST NAME	Value	Unit
WBC	3.8	$10^3/\mu\text{l}$
RBC	4.47	$10^6/\mu\text{l}$

For example, your blood's Vitamin C level is a good marker to show if you are eating whole fruits and vegetables.

Your blood's Vitamin D level is a good marker to show if your immune system is working.

Nutrition has a significant impact on your immune system because it directly affects your gut function.

According to research, both blood chemistry and immune systems improve faster through nutrition, than with exercise alone.

The natural bacteria in your gut (immune system) are designed to digest (eat) fiber.

- Beans (all varieties),
- cruciferous vegetables (broccoli, kale, cauliflower, cabbage, brussels sprouts),
- and a variety of whole, fresh fruits and vegetables.

It's well documented people living in countries with no chronic disease including cancer eat high fiber foods and have daily bowel movements.

Human migration studies show when people move to the U.S. they have more chronic disease due to the low fiber foods they eat in America.

The FDA regulates food labels however, there are loopholes in the regulations that make it tricky to understand them.

Fresh fruits and vegetables don't require a food label. Nor does beans, peas, lentils and other plants that have a ton of natural fiber in them.

There's a global concern about the use of antibiotics and how it affects our gut (immune system) and overall health.

The World Health Organization is concerned with the “overuse” of antibiotics.

The FDA estimates that 80% of antibiotics are used in the meat industry.

WHAT TO DO:

KNOW YOUR BLOOD CHEMISTRY

Including your Vitamin C and Vitamin D levels

EAT HIGH FIBER / FRESH WHOLE FOODS WITHOUT TRICKY LABELS

Fruits, Vegetables, Fiber (beans, lentils, chickpeas, oats, etc.)

Your Immune system Improves, and your injury rate declines.

EXERCISE

Affects Your Injury Rate

Exercise improves your mental and physical being.

A ton of research backs this up.

Exercise gives you an edge because it produces more immune cells.

Exercise gives you the edge because it lowers your stress hormone levels, making you more calm.

Exercise gives you the edge
because you sleep better.

Exercise gives you the edge because you are in a better mood.

You're an Athlete

Your work is your 'playing field.'

Like the pros, work out, eat right,
and practice using correct form
to stay in the game.

And, you don't get injured.
